# Legend

Steel Joint module is a part of the FEM-Design software package and this user manual covers only the specific features of this module.

All the additional information is available in the *FEM-Design User Manual* that is accessible from the Steel Joint *Help* menu. We highly recommend reading the following chapters of *FEM-Design User Manual*:

# 1. Starting the program

The Steel Joint module can be started in one of the following ways:

- Click Start button of Windows status bar and select All programs -> FEM-Design...

- Click *Windows Taskbar -> FEM-Design System tray* (1), if it is installed by default.

- Double click on the FEM-Design 15 shortcut, if it is placed on the Desktop.

When starting the Steel Joint module a *Code, configuration* dialog pops out. Here the user has to select a code for the calculation. The code selection influences the values of safety factors, as well as the range of available modelling materials.

# 2. Introduction

The Steel Joint module covers 51 joints that are classified into 7 types:

- Column splice
- Beam splice
- Column base
- Beam to beam
- Beam to column
- Knee
- Bracing

Each type includes several solutions, where different bar cross-section or different components are used, (end plate, splice plate, weld, bolt...). Solutions may include additional options that can be chosen for different number of joined bars or different bar topology (e.g. Y, X, K bracing joints).

The following table shows all the possible joints.

# 3. Steel joint

# 3.1. User interface

The user interface of the standalone module contains the following parts:

- Navigation panel
- 3D model of the joint
- Calculation window
- Collection
- Enter Documentation module

Toolbars, Menu bar and Status bar are the standard FEM-Design components that are located in all modules' interface (see FEM-Design User Manual, *Basic concept -> User interface* chapter).

# Navigation panel

Navigation panel is located on the left side. All user input takes place on this panel.

# 3D model of the joint

The 3D model of the joint is located on the right side. It is updated in real time. When any joint's parameter is modified, the 3D model will be updated immediately.

# Calculation window

Calculation window by default is placed in Navigation panel, in the Design panel. The user can however, change its position. This window displays calculations, errors and warnings.

# Collection

The collection of the designed joints is located at the up-left corner. In this part of the interface the designed joints can be selected for modification.

# **Entering Documentation module**

The button to enter the Documentation module is located on the top-right corner. For more information see Chapter 2.7.

# 3.2. Joint

Designing of a joint in the standalone module is performed in 3 main steps.

- Selecting a joint
- Setting data
- Designing the joint

First, the user has to choose a joint type (1), then a solution (2), and an option (3), if available. User can step forward to the *Data* panel by clicking on the *Next* button (4).

# 3.3. Data

# **Basic data**

In the up-right of the *Data* panel the following data of bars connected to a joint can be set:

- Cross-section(s)
- Material(s)
- Geometry (in some solutions)
- Buckling data (in case of column splices and column bases, more details come later)

sasic data				Dat	a	1	Value	
				Dat ross-section	a Fi <b>ki k</b> a	HE-A 300	value	
3	2		M	aterial 1.	1.	S 355		
			0	ross-section	2.	IPE 300		
			м	aterial 2.		S 355		
	1		0	ross-section	3.	IPE 300		
			М	aterial 3.		S 355		
M2 N2 T2	• T1 N1 M1							
M2 N2 T2	• Ti Ni Mi	N	T1	M1	N2	12	M2	
No	• T <sub>1</sub> N <sub>1</sub> M <sub>1</sub>	N1 [kN]	T1 [kN]	M1 [kNm]	N2 [kN]	T2 [kN]	M2 [kNm]	-
M2 N2 T2	• T <sub>1</sub> N <sub>1</sub> M <sub>1</sub>	NI [kN]	T1 [kN]	M1 [kNm]	N2 [KN]	T2 [kN]	M2 [kNm]	•
No No	• ↓ ↓ Name	N1 [M]	T1 [kN]	M1 [klim]	N2 [kN]	T2 [kN]	M2 [kNm]	
No	Name	N1 [bo]	T1 [kN]	M1 [kNrm]	N2 [kN]	T2 [kii]	M2 [kkim]	

The program will automatically set the geometry of the joint components if the *Setup components automatically when cross-section changed* option is enabled. Otherwise, the components will not be modified after the cross-section has changed.

Data	Value			
Cross-section 1.	IPE 300			
Material 1.	S 355			
Cross-section 2.	IPE 200			
Material 2.	S 355			
Setup components automatically when cross-section changed				

#### a. Cross section

The section library displays only those sections that are relevant for selected joint type. The library can be exported to a file, or imported from a file.

Steel sections → HE-A - 100 - 120 - 140 - 160 - 180 - 200 - 220 - 240 - 260 - 280 - 30	Section library		^		2	
HE-A - 100 - 120 - 140 - 160 - 180 - 200 - 220 - 240 - 260 - 280 - 300 - 320 - 340 - 360 -	Steel sections	1		0		
- 100 - 120 - 140 - 160 - 180 - 200 - 220 - 240 - 260 - 280 - 300 - 320 - 340 - 360 New > Modrfy Delete Import Export	B-HE-A					
- 120 - 140 - 160 - 180 - 200 - 220 - 240 - 260 - 280 - 300 - 320 - 340 - 360 New > Modrfy Delete Import Export	- 100					
- 140 - 160 - 180 - 200 - 220 - 240 - 260 - 280 - 300 - 320 - 340 - 360 New > Modrfy Delete Import Export	- 120				1	
- 160 - 180 - 200 - 220 - 240 - 260 - 280 - 300 - 320 - 340 - 360 New > Modry Delete Import Export	- 140			1		у
- 180 - 200 - 220 - 240 - 260 - 280 - 300 - 300 - 320 - 340 - 360 -	- 160				-	
- 200 - 220 - 240 - 260 - 280 - 300 - 320 - 340 - 360 New > Modify Delete Import Export	- 180					
- 220 - 240 - 260 - 280 - 300 - 300 - 320 - 340 - 360 New > Modify Delete Import Export	- 200					
- 240 - 260 - 280 - 300 - 320 - 340 - 360 New > Modify Delete Import Export	- 220					
- 260 - 280 - 300 - 320 - 340 - 360 New > Modify Delete Import Export	- 240				2	
- 280 - 300 - 320 - 340 - 360 New > Modify Delete Import Export	- 260					
	- 280		A	=	11253 mm2	
- 320 - 340 - 360 New > Modify Delete Import Export	- 300		P	=	1717 mm	
	- 320		A/F	° =	6.56 mm	
New > Modify Delete Import Export	- 340					
New > Modify Delete Import Export	360		~ (Yg	=	0.000 mm)	
	New > Modify	Delete	Impo	ort	Export	

In the cross-section library only the same type of sections can be imported.

If a new section needs to be created, or the user wants to modify or delete the existing sections, it can be done in the *Edit section library* dialog, or by launching the *Section Editor* from the Tools menu (or the Toolbar).

For more information about section editing, see FEM-Design User Manual, *Structure Definition -> Properties -> Cross-section* chapter.

#### b. Material

The material library contains some standard steel grades. The library can be exported to a file, or imported from a file.

Material		
Library	Application data	
<ul> <li>Geteel</li> <li>S 235</li> <li>S 275</li> <li>S 355</li> <li>S 420</li> <li>S 450</li> <li>S 460</li> <li>Used materials</li> <li>Geteel</li> <li>S 355</li> </ul>	Ultimate         Acc./Seis.           Gamma M0         1.10         1.00           Gamma M1         1.20         1.00           EN 1993-1-8 specific:         Gamma M2         1.35           Gamma M2         1.35         1.00           Gamma M5         1.10         1.00	>
New Modify Delete	Import Export	
	OK Can	cel

In the material library there is a new partial factor called *Gamma M5*, which refers to the resistance of hollow and pipe sections (see Eurocode 1993-1-8, 2.2).

The user can create a new material by pressing the *New* button.

Library material			>
Name		New steel material	
Yield strength - fyk, for nominal thickness - t [N/mm2]		Ultimate tensile strength - fuk, for nominal thickness - t [N/mm2]	
t < 16 mm	355	t < 3 mm	510
16 <= t <= 40 mm	345	3 <= t <= 40 mm	470
40 < t <= 63 mm	335	40 < t <= 100 mm	470
63 < t <= 80 mm	325	100 < t <= 150 mm	450
80 < t <= 100 mm	315	150 < t <= 250 mm	450
100 < t <= 150 mm	295	250 < t <= 400 mm	450
150 < t <= 200 mm	285	Modulus of elasticity - Ek [N/mm2]	210000
200 < t <= 250 mm	275	Shear modulus - G [N/mm2]	80769
250 < t <= 400 mm	265	Poisson's ratio (in elastic stage) - nu	0.30000
		Mass density - rho [t/m3]	7.85
		Thermal coefficient - alpha [1/ºC]	0.0000120
		ОК	Cancel

#### c. Geometry

In case of some joints it is possible to define the inclination of bars.

	Data	Value
2 3	Cross-section 1.	KKR 200x200x10
	Material 1.	S 355
	Cross-section 2.	KKR 100x100x8
	Material 2.	S 355
1	a2 [mm]	1000
177.	b2 [mm]	1000
	Cross-section 3.	KKR 100x100x8
	Material 3.	S 355
	a3 [mm]	1000
	h3 [mm]	1000

# d. Buckling data

In some joints buckling data are present. They are considered in automatic calculation of 2nd order effects, if necessary.

		Data	Value
1		Cross-section	HE-A 300
		Material	S 355
	Lor	Lcr, y [m]	6.00
	++	x, y [m]	2.00
	x	Lcr, z [m]	6.00
	++ *	x, z [m]	2.00

## Load combinations

Load combinations can be defined at the bottom of the *Data* panel.

					Data	2	1	alua
				Cre	ss-section	1.	HE-A 300	uiue
	3	2		Ma	terial 1.		\$ 355	
1				Cro	ss-section	2.	IPE 300	
				Ma	terial 2.		S 355	
				Cri	ss-section	3.	IPE 300	
				Ma	terial 3.		S 355	
M2 1	V2 T2							
No M2 I	V2 T2 ↓	Name	N1 [kN]	T1 [kN]	M1 [kNm]	N2 [kN]	T2 [kN]	M2 [kNm]
No 1	V2 T2 -↓	Name	N1 [kH] -200	T1 [kN] 80	M1 [kNm] -80	N2 [kN] -150	T2 [kn] 90	M2 [kNm] -90
No 1	V₂ T₂	Name	NI [kH] -200 50	T1 [kN] 80 70	M1 [kNm] -80 -60	N2 [kN] -150 80	T2 [kN] 90 80	M2 [kNm] -90 -80
No No	V₂ T₂ ↓ . LC1 . LC2 . LC3	Name	N1 [kli] -200 50 -150	T1 [KN] 80 70 85	M1 [kNm] -80 -60 -90	N2 [kN] -150 80 -100	T2 [k4] 90 80 70	M2 [kNm] -90 -80 -70

A selected load combination can be deleted by pressing *Delete*.

The  $2^{nd}$  order effect is considered in column splice and column base joints. If  $2^{nd}$  order calculation is marked by X in the *Load combinations* table, it is supposed that the internal forces come from  $2^{nd}$  order calculation.

Otherwise, internal forces are supposed to come from 1<sup>st</sup> order calculations and 2<sup>nd</sup> order effect is calculated automatically, based on the buckling data defined by the user in the *Basic data* table.

The user can step forward to the *Design* panel by clicking on the *Next* button.

# 3.4. Design

# Modify, add and remove components

In the *Design* panel, components of the joint (e.g. end plate, splice plate, bolts, weld, etc.) can be modified. Additionally, some components such as stiffeners, haunches, etc. can be added or removed by setting *Yes/No* option in *Apply*.

A selected component is always highlighted in orange color in the 3D model.

![](_page_19_Figure_4.jpeg)

# Bolts

By selecting *Bolts* the user can define the bolt's size, quality and other parameters.

The *Bolt library* provides a possibility to create, modify, and delete the bolts, as well as the import or export from / to a file.

a. Bolt size

bolt

![](_page_20_Figure_1.jpeg)

# b. Bolt position in general case

In general cases (like splice plates, fin plates, etc.) the number of the bolt rows, columns, distance between the columns (c), distance between the rows (e) and the distance of the first row from the plate's edge (e0) can be set by the user. The bolt columns are automatically positioned symmetrically in the plate.

![](_page_21_Figure_2.jpeg)

# Bolt position parameters

![](_page_21_Picture_4.jpeg)

The bolts arrangement figure is automatically refreshed when changes are applied.

If in some cases, the bolts arrangement drawing and the dimensions are too small or too big, it is because the figure is not scaled properly. The user has the opportunity to change the scale of the drawing in order to see the figure clearly.

![](_page_21_Figure_7.jpeg)

c. Bolt position in end plate for moment-resistant joints

In case of end plates for moment-resistant joints the user has more possibilities to define the bolts position.

There may be either 2 or 4 bolts in a row and the distance between the inner bolts (c1) and the outer bolts (c2) have to be set. Then for each row the user can define the:

- Number of the bolts
- Distance of the row relative to one of the following positons:
  - Top flange
  - Bottom flange
  - Top haunch (if available)
  - Bottom haunch (if available)
  - Bottom plate edge
  - Top plate edge
  - Previous bolt row

![](_page_22_Figure_12.jpeg)

# Change solution

*Change solution* button is located in the bottom-right of the *Design* panel. A joint solution can be changed only if there is/are another solution(s) available (if the button is active). When the solution is changed, internal forces will remain the same.

![](_page_23_Figure_0.jpeg)

![](_page_23_Figure_1.jpeg)

![](_page_23_Figure_2.jpeg)

# 3.5. Calculation window

# Content

Utilizations and a failure mode of the joint are displayed in the *Calculation* dialog. Each calculation has a reference to the specific standard.

The calculation results can be displayed either for the maximum, or for selected load combination.

![](_page_24_Picture_4.jpeg)

# Moving the calculation window

The *Calculation* window is located at the bottom left corner as default, but the user can relocate it by docking the window to the blue arrows shown below.

![](_page_24_Figure_7.jpeg)

![](_page_25_Picture_0.jpeg)

When the *Calculation* window is docked on the bottom-left (default solution) it is not visible in the interface in *Joint* and *Data* panels – only in *Design* panel.

If the user wants to see the window in all interfaces, then it should be relocated to one of the remaining four docking positions.

# 3.6. Collection

The purpose of *Collection* is to collect and document the joints that belong to one model.

When a joint is designed, it can be added to the collection by clicking on *Finish* button and assigning a name to it.

	Joint name
Calculation	
Maximum	T I
$\label{eq:constraint} \begin{array}{ c c c c c } \hline Through-thickness requirements, Beam 1 -> End-plate (EN 1993) \\ Z_a = 3.00, Z_b = 0.00, Z_c = 4.00, Z_d = 0.00, Z_e = 0.00 \\ Z_{Ed} = 7.00 \\ \hline Through-thickness requirements, Beam 2 -> End-plate (EN 1993) \\ Z_a = 3.00, Z_b = 0.00, Z_c = 4.00, Z_d = 0.00, Z_e = 0.00 \\ Z_{Ed} = 7.00 \\ \hline \end{array}$	-1-10: [3.2; (2)]) -1-10: [3.2; (2)])
< Back	Change solution Finish

After saving the designed joint, a new joint can be started. Designed joint can be reloaded from the list for modification.

![](_page_25_Picture_8.jpeg)

Any joint in *Collection* can be displayed in a separate dialog along with a 3D model of it. In this dialog the user can rename, copy or delete the joints.

![](_page_26_Picture_0.jpeg)

![](_page_26_Picture_1.jpeg)

The 3D preview area behaves like the model space in other modules, therefore:

- right clicking in the model space will pop up the view commands,
- dragging the view by holding the middle mouse button will animate pan the view,
- using the wheel on the mouse will zoom in and out the model view,
- using CTRL + middle mouse button will animate rotate the model view.

![](_page_26_Figure_7.jpeg)

# 3.7. Documentation

# General

FEM-Design automatically generates documentation for each joint added to the *Collection*. The documentation is located in *Documentation* module.

The documentation contains the input data of the joint (Member data, Load combinations, data of all components) and detailed calculations, so called detailed result.

# Click on the Documentation icon to enter Documentation module

Joint	
New	
Collection	Docu
	<page-header><page-header><page-header><section-header><section-header></section-header></section-header></page-header></page-header></page-header>
a to the based of the second s	

# Printing

a. Setup a printer

The printing process requires a printer(s) associated with the section(s) of the current documentation. If a section does not have a defined printer (*Undefined*), you can add one by:

- selecting the section name in the document list (1),
- pressing *Properties* button in the Control panel (2),
- pressing Printer setup button (3),
- Selecting a printer from the dropdown list (4).

Documentation

![](_page_28_Picture_1.jpeg)

If you assign a PDF printer all sections, you can save your documentation as a PDF file.

## b. Print range

The completed document, or only some parts of it, can be printed out with Control Panel's *Print* tool or *File -> Print document*.

The user can set the *Page rage* as:

- *All* -> The whole document (all pages) will be printed out.
- *Selection* -> The objects selected in the *Control panel* (multi-selection also works) and their pages will be printed out.
- *Pages* -> Only selected pages will be printed. Enter page number and/or page ranges by separating with commas and by using "-" (an example: 1,10,15-20,25, etc.).

Print document	×

The own template must be based on the original template file called *Template for femdesign document templates.dotx* located in your local user folder at your PC *in Documents*\*FEM-Design document templates* folder, as this file contains the style required for the correct export.

MS Office Word 2007 or newer is required for opening files with .docx distribution.

It is highly recommended to mark the documentation sections in the exported file, since the page rendering in MS Word and in FEM-Design are different. Furthermore, the exported document has A4 format pages. Therefore, if there are pages in the FD Documentation with different size, it is easier to find them and change their size in the result .docx file with section marks.

Using own Word templates is useful when the FEM-Design documentation contains Title block, since it is not possible to export it to .docx. As an alternative, the user can create a Word template with custom headers and footers, and use it for the export.

Since MS Word has more sophisticated solutions for creating the table of contents, FEM-Design does not export it to the .docx document. However, the chapters are exported therefore, the table of contents can be created in MS Word easily.

More information and useful hint can be found in the *Save as .docx FAQ* document accessible from the Help menu.

## Advanced documentation tools

Documentation module is a powerful tool that allows you to create multi-page documentation with titles, figures, texts, tables, images, headers, footers, table of content etc.

In order to find out more about all the possibilities that the documentation module can offer, please read the *Documentation -> Documentation module* chapter in *FEM-Design User Manual*.
